Actin Comets versus Membrane Ruffles: Distinctive Roles of Phosphoinositides in Actin Reorganization

Takanari Inoue
Assistant Professor
**Johns Hopkins University School of
Medicine**

Complexity in intracellular signaling networks is often derived from co-opting particular sets of molecules for multiple operations. Understanding how cells achieve such sophisticated processing using a finite set of molecules within a confined space is critical to biology and engineering as well as the emerging field of synthetic biology. Phosphoinositides, a small group of lipids found in various cellular membranes, oversee diverse cellular functions including cell proliferation, differentiation, and cell migration. However, the question of how this limited number of lipids can drive multiple cellular functions and differentially contribute to diseases mediated by aberrant phosphoinositide regulation remains unaddressed. Using a recently developed technique to rapidly manipulate the level of specific phosphoinositides, we aim to elucidate how a limited set of phosphoinositides achieves functional diversity at the molecular level.

June 8th, Tue. 17:00~

**Faculty of Medicine, Building F,
Seminar room (1F)**

**Department of Pathology and Biology of Diseases,
Graduate School of Medicine, Kyoto University,**

Michiyuki Matsuda (ext. 4421)
